

NetOp School

Modification notes – version 5.00, 2007058

Current version	5.00
Latest build	2007-058
Shipping from	2007-03-12

Fixes

- ✓ **License enforcement check**
The license enforcement check would wrongly complain about using too many copies of the program even though the limit had not been reached.
The problem has been corrected.
- ✓ **Various improvements in wifi communication**
A number of optimizations have been made to improve speed and stability on wireless networks, especially for handling of the unavoidable packet loss on wireless networks.
- ✓ **Test Center - Scoring**
The value fields in the graphical scoring sheet would not accept anything else but numbers. This prevented a manual entry of values with decimals.
Now working correctly.
- ✓ **Test Center – error on Student side**
Sometimes an error message would report problems on distributing the Tests to the Students. This was caused by an error in setting the necessary permissions to copy the test to the appointed directory on the Student side.
The problem is now solved.
- ✓ **Activity View – errors resulting in crash**
Sometimes on switching to the Activity View the Teacher would crash due to high activity while building the list of active Student applications and websites.
The problems are now corrected.
- ✓ **Spanish version - Help**
The Spanish version was delivered with an English help system. The problem is now corrected.

Modification notes – version 5.00, 2006348

Current version	5.00
Latest build	2006-348
Shipping from	2006-12-15

Fixes

- ✓ **Various Policy issues**

A number of end users have experienced problems in connection with applying Internet policies for blocking sites. In some situations wrong system permissions were set to local Student folders, causing the applied Policies not to work correctly or at all.
- ✓ **Various improvements in wifi communication**

A number of optimizations have been made to improve speed and stability on wireless networks, especially for handling of the unavoidable packet loss on wireless networks.
- ✓ **Minimized Teacher in Notification area (tray) only**

The behavior of the Teacher module being minimized to the notification area (Tray) only, has been changed, since some users by policy would hide this area. The Teacher module now minimizes to the taskbar as well.
- ✓ **Test designer – certain languages**

In some languages (e.g. Korean, Hebrew) characters or sequences of characters were not displayed correctly in a few types of questions.
- ✓ **Startup Policy**

If you created a policy with the text string “None ...”, or more precisely with what corresponds to “None” in a local language (e.g Dutch “Geen Word”), then the classroom startup policy would always use that policy instead of the default “None” (“Geen”). Thus you could never have “no Policy/None” again.

This problem would rarely-to-never occur in English, since you wouldn't use “None” in combinations. The problem would only occur in languages where the translation of “None” would be used in combinations.
- ✓ **User interface changes for Asian languages**

Text boxes in certain dialogs expanded to be able to contain all lines and characters.
- ✓ **User interface changes for Hebrew version**

File manager interface was not correctly right-to-left oriented.
- ✓ **Registration popup reminder removed from Student**

If you still need this reminder to popup on the Student modules, you need to add the following to the netop.ini file:

```
[STUDENT]
Registrate=1
```
- ✓ **Failure in certain localized versions when using MSI version**

If the module was installed with MSI to a directory with non-ansi characters (instead of just Teacher and Student), which is the case in a number of localized versions, then the program would fail in many areas using these structures (Policy, Messages, etc.).
